John Louise Tan
Senior Android Developer

Programming Languages, Tools and Frameworks

- Kotlin (Native Android and Kotlin Multiplatform)
- Jetpack Compose and XML Views (ViewBinding/DataBinding)
- Android Components and Lifecycle Management
- WorkManager
- MVVM and MVI Architecture
- Kotlin Coroutines and Flow
- Hilt, Dagger and Koin
- Coil, Glide
- Retrofit, Ktor
- Room
- Android Testing (JUnit, Compose UI testing, Espresso, MockK, Robolectric)
- Gradle Kotlin DSL, modularization and convention plugins
- Git
- CI/CD configuration using Zuul and Bitrise
- AI-assisted development using GitHub Copilot and Claude Code

Knowledge and Skills

- Android Automotive OS (AAOS) integration and driver distraction guidelines
- Backend communication using REST APIs and MQTT
- Agile/Scrum planning and task breakdown

Neu-Ulm, Germany (relocating to Philippines, UTC+8)

Filipino citizen

Summary

Senior Android Developer with 9 years of experience (7 years in Android), specializing in Kotlin, Jetpack Compose and Kotlin Multiplatform across automotive (BMW AAOS) and e-commerce applications. Experienced in remote and hybrid work, currently based in Germany and relocating to the Philippines (UTC+8), able to work US or EU hours.

Work Experience

Paradox Cat GmbH, Germany
(Hybrid, mostly remote)

Senior Developer (Android)
July 2024 – Present

Responsibilities:

- Provide technical expertise on various BMW Android Automotive OS (AAOS) telematics use cases across multiple ECUs to support planning and requirement specification, while implementing and maintaining these features
- Guide teammates in improving and maintaining code quality across multiple applications through code reviews and technical discussions
- Introduce process and workflow improvements that speed up development and keep applications up to date

Achievements:

- Led architectural changes in multiple applications by shifting towards a unidirectional data flow (MVI) architecture and introducing multi-user communication using AIDL. This reduced core functionality defects and crashes by ~90%, while also improving application performance and reducing development time
- Improved code quality across 10 applications by initiating the creation of local unit tests and instrumented tests, which raised code coverage to over 80%
- Set up GitHub Copilot skills and agent guidelines to keep AI-assisted code consistent with the applications' architecture and code quality standards and enable coding agents to run tests on ECU emulators

Software Developer
August 2022 – June 2024

Responsibilities:

- Implemented and maintained multiple telematics use cases across 10 BMW AAOS applications, which involved backend communication via MQTT and REST APIs, call handling, vehicle signal processing and video playback
- Tested applications at multiple testing levels across different ECUs and vehicle configurations, and integrated them into Zuul CI/CD pipelines for automated testing and release

Achievements:

- Enabled application releases for new BMW vehicle generations by adding multi-ECU support, which involved building new Jetpack Compose screens across multiple applications, maintaining multiple backend communication frameworks and data structures, and supporting multiple product flavors in the CI/CD pipeline
- Built 2 applications from scratch and rebuilt 1 application from the ground up to support new telematics requirements

BeautyMnl, Philippines
(Remote from 2020)

Mobile Developer (Android)

July 2019 – April 2022

Responsibilities:

- Led, designed and developed features across various areas of the BeautyMnl e-commerce Android application, primarily using Kotlin
- Coordinated with different departments to finalize feature requirements and dependencies, and provided input on the UI/UX design of application mockups
- Maintained application stability by monitoring and addressing Firebase Crashlytics issues and integrated analytics using Firebase Analytics

Achievements:

- Rebuilt the BeautyMnl application from the ground up to support major UI/UX and architectural changes, which enabled the company's rebranding and made the codebase easier to maintain through the introduction of MVVM architecture and a shift to Kotlin Coroutines with Retrofit
- Increased checkout conversions by launching a loyalty program and promo codes, and improved user retention by introducing interactive in-app product reviews
- Eliminated a 20-30-minute manual deployment process by initiating the creation of a CI/CD pipeline using Bitrise
- Initiated the creation of unit tests for the mobile application to reduce issues and ensure that features stay intact and documented as the code changes

Nokia Technology Center, Philippines

Team Technical Lead and Code Guard

February 2019 – June 2019

Deputy Code Guard

October 2018 – February 2019

Scrum Feature Owner and R&D Engineer

July 2017 – October 2018

- Progressed from R&D Engineer to Team Technical Lead in less than 2 years, serving as the team's point person for technical specifications and primary code reviewer for correctness, optimization and readability
- Enabled system demos of the company's main product by spearheading the introduction of data traffic features in a 5G network component simulator
- Paved the way for future development configurations by leading the initial virtualization of multiple network component simulators
- Developed and tested 5G network component simulator features using C++ and wrote technical specifications covering virtualization, networking, platform compatibility and component integration
- Coordinated with multiple teams to define feature specifications, timelines and dependencies, and broke features down into user stories for sprint planning

Projects

Wais – Personal Project

In internal beta testing

- Built an MVP of a budget tracker app catering to Filipinos using Kotlin Multiplatform with shared business logic and UI across Android and iOS, distributed to beta testers via the Google Play internal testing track and Apple TestFlight
- Tech Stack: Compose Multiplatform, Ktor, Room KMP, Koin, Kotlin Coroutines and Flow, Firebase Crashlytics and Analytics, Gradle Kotlin DSL
- Designed the application with a multi-modular approach and a unidirectional data flow architecture, storing transaction and account data locally and supporting offline-first currency conversions
- Use Claude Code with custom skills to maintain architecture and code quality while expanding features based on beta feedback
- GitHub: https://github.com/jolotan416/WaisPublic

Education

University of the Philippines Diliman – BS Computer Science, Cum Laude

2013 – 2017

- Hackathons: Champion at Hackzilla and Hack UP, 3rd Place at Accenture: Program the Future
- Marketing Head, Association for Computing Machinery (UP Diliman Student Chapter)
